Raburn breakdown station saves labor, reduces breakage

ST. PAUL, Minn.-- July 8, 1998 - A breakdown station for dishes that saves labor, reduces breakage and improves safety is now available from the Raburn equipment line of Ecolab Inc.

The SORTMASTER BREAKDOWN STATION goes where the action is. It increases productivity and enhances employee safety by allowing workers to scrape, sort and rack soiled ware in the dining area. Because soiled dishes can be removed and racked in the dining area, the number of trips to the dishroom is greatly reduced, saving labor. The station also can be used to expedite transporting clean dishes to the dining area for setting tables.

The close proximity of the cart to the tables means fewer dishes are damaged and broken in transit. Stacked dishes travel safety across thresholds to or from the dishroom. The danger of back strain or an accident from lifting and carrying over-loaded trays and bus tubs is eliminated. There is less breakage, reducing the possibility of cuts.

An optional plate scraper mounts to the right side of the station making it easier and more sanitary to remove plate waste. The station has built-in arms to hold an optional SILVER MASTER SYSTEM which allows immediate soaking of stainless or silverware.

Ecolab Inc is the leading worldwide developer and marketer of premium cleaning, sanitizing and maintenance products and services for the healthcare, hospitality, institutional and industrial markets. For additional information about Ecolab, visit the company's web site at www.ecolab.com.
