**CLIMATE
STRATEGY** REPORT

CAUTIONARY STATEMENT

The B2Gold Corp. (“B2Gold” or the “Company”) Climate Strategy Report has been finalized as of April 12, 2023, and contains certain “forward-looking information” and “forward-looking statements” (collectively “forward-looking statements”) within the meaning of applicable Canadian and United States securities legislation, including projections; outlook; guidance; forecasts; estimates; and other statements regarding future or estimated financial and operational performance events, gold production and sales, revenues and cash flows, capital and operating costs, including projected cash operating costs and all-in sustaining costs, and budgets; future or estimated mine life, metal price assumptions, ore grades or sources, and ore processing; statements regarding anticipated exploration, drilling, development, construction, permitting and other activities or achievements of B2Gold; and including, without limitation: the significant steps B2Gold is taking to address climate change risks to maintain the resilience of our business and across our operations, the set of actions as part of B2Gold’s climate strategy to move the Company towards achieving a 30% reduction in greenhouse gas (GHG) emissions by 2030 (from a 2021 baseline) and towards a net zero operation, at Otjikoto and Fekola, the estimated emissions of the heavy fuel oil generators, the projected reduction in fuel consumption and GHGs as a result of the solar plants; the completion of the Fekola solar plant expansion by the third quarter of 2024; statements regarding our plans, programs and anticipated future achievements relating to audits, sustainable development (including the United Nations Sustainable Development Goals), climate change, the environment, the ecosystem, conservation and biodiversity strategies and measures, reclamation, mine rehabilitation and closure planning, water and water management, waste and tailings management, reporting practices and systems and internal systems and practices. All statements in this presentation that address events or developments that we expect to occur in the future are forward-looking statements. Forward-looking statements are statements that are not historical facts and are generally, although not always, identified by words such as “expect”, “plan”, “anticipate”, “project”, “target”, “potential”, “schedule”, “forecast”, “budget”, “estimate”, “intend” or “believe” and similar expressions or their negative connotations, or that events or conditions “will”, “would”, “may”, “could”, “should” or “might” occur.

Forward-looking statements necessarily involve assumptions, risks and uncertainties, certain of which are beyond B2Gold’s control, including risks associated with or related to: the volatility of metal prices and B2Gold’s common shares; changes in tax laws; the dangers inherent in exploration, development and mining activities; the uncertainty of reserve and resource estimates; not achieving production, cost or other estimates; actual production, development plans and costs differing materially from the estimates in B2Gold’s feasibility studies; the ability to obtain and maintain any necessary permits, consents or authorizations required for mining activities; environmental regulations or hazards and compliance with complex regulations associated with mining activities; climate change and climate change regulations; the ability to replace mineral reserves and identify acquisition opportunities; the unknown liabilities of companies acquired by B2Gold, including Sabina; the ability to successfully integrate new acquisitions; fluctuations in exchange rates; the availability of financing; financing and debt activities, including potential restrictions imposed on B2Gold’s operations as a result thereof and the ability to generate sufficient cash flows; operations in foreign and developing countries and the compliance with foreign laws, including those associated with operations in Mali, Namibia and the Philippines and including risks related to changes in foreign laws and changing policies related to mining and local ownership requirements or resource nationalization generally; remote operations and the availability of adequate infrastructure; fluctuations in price and availability of energy and other inputs necessary for mining operations; shortages or cost increases in necessary equipment, supplies and labour; regulatory, political and country risks, including local instability or acts of terrorism and the effects thereof; the reliance upon contractors, third parties and joint venture partners; the lack of sole decision-making authority related to Filminera Resources Corporation, which owns the Masbate Gold Project; challenges to title or surface rights; the dependence on key personnel and the ability to attract and retain skilled personnel; the risk of an uninsurable or uninsured loss; adverse climate and weather conditions; litigation risk; competition with other mining companies; community support for B2Gold’s operations, including risks related to strikes and the halting of such operations from time to time; conflicts with small-scale miners; failures of information systems or information security threats; the ability to maintain adequate internal controls over financial reporting as required by law, including Section 404 of the Sarbanes-Oxley Act; compliance with anti-corruption laws, and sanctions or other similar

measures; social media and B2Gold’s reputation; risks affecting Calibre having an impact on the value of the Company’s investment in Calibre, and potential dilution of our equity interest in Calibre; as well as other factors identified and as described in more detail under the heading “Risk Factors” in B2Gold’s most recent Annual Information Form, the Company’s current Form 40-F Annual Report and B2Gold’s other filings with Canadian securities regulators and the U.S. Securities and Exchange Commission (the “SEC”), which may be viewed at www.sedar.com and www.sec.gov, respectively (the “Websites”). The list is not exhaustive of the factors that may affect the Company’s forward-looking statements. There can be no assurance that such statements will prove to be accurate, and actual results, performance or achievements could differ materially from those expressed in, or implied by, these forward-looking statements. Accordingly, no assurance can be given that any events anticipated by the forward-looking statements will transpire or occur, or if any of them do, what benefits or liabilities B2Gold will derive therefrom. The Company’s forward-looking statements reflect current expectations regarding future events and operating performance and speak only as of the date hereof, and the Company does not assume any obligation to update forward-looking statements if circumstances or management’s beliefs, expectations or opinions should change other than as required by applicable law. The Company’s forward-looking statements are based on the applicable assumptions and factors management considers reasonable as of the date hereof, based on the information available to management at such time. These assumptions and factors include, but are not limited to, assumptions and factors related to the Company’s ability to carry on current and future operations, including development and exploration activities; the timing, extent, duration and economic viability of such operations, including any mineral resources or reserves identified thereby; the accuracy and reliability of estimates, projections, forecasts, studies and assessments; the Company’s ability to meet or achieve estimates, projections and forecasts; the availability and cost of inputs; the price and market for outputs, including gold; the timely receipt of necessary approvals or permits; the ability to meet current and future obligations; the ability to obtain timely financing on reasonable terms when required; the current and future social, economic and political conditions; and other assumptions and factors generally associated with the mining industry. For the reasons set forth above, undue reliance should not be placed on forward-looking statements.

MESSAGE FROM

THE DIRECTOR, SUSTAINABILITY

I am pleased to present B2Gold Corp.'s (B2Gold) third Climate Strategy Report, marking a significant milestone in our ongoing commitment to transparently address climate-related risks and opportunities. In response to the escalating global challenges posed by climate change, we have not only maintained but strengthened our commitment to proactive climate measures. The evolving landscape of our operating environment, both physical and societal, has prompted B2Gold to take the necessary steps to ensure the resilience of our business and the communities where we operate. We understand that climate change is not just a sustainability concern but also a critical component of our overall business strategy and planning process.

B2Gold made significant progress on its climate strategy in 2023; the details of which are described throughout this Report. In 2023, we began the financial assessment of key climate risks identified at sites during previous climate scenario analysis workshops. This work not only aims to mitigate immediate risks but also to lay the groundwork for achieving our commitment of a 30% reduction in Scope 1 and 2 emissions by 2030. In 2023, each operation developed site-specific Climate Action Plans, identifying local climate risks, energy efficiency and reduction measures, climate adaptation, and employee and community awareness actions. In 2024, we will increase the proportion of renewable energy used at two of our operations. The completion of the expansion of the Fekola solar plant in Mali is projected to reduce greenhouse gas (GHG) emissions by approximately 23,800 tonnes per year. In Namibia, the commissioning of a third-party solar facility toward the end of the year will provide an additional 25% of the Otjikoto Mine's electricity from renewable sources. In addition to increasing the proportion of renewable energy sources in our electricity supply, we are also evaluating and monitoring several additional avenues for carbon reduction, including energy efficiency and reduction, alternative fuels, optimizing fleet management

and materials movement. We are committed to staying at the forefront of innovation by collaborating with industry-leading suppliers, ensuring readiness to adopt emerging technologies that align with their decarbonization goals.

As we navigate the complexities of the global climate emergency, our third Climate Strategy Report showcases how B2Gold is increasingly embedding climate risk management in our business planning and investment decisions. Looking ahead, we remain dedicated to contributing meaningfully to global efforts to limit warming and address the impacts of climate change. B2Gold's journey in climate risk management is an ongoing narrative of proactive adaptation and strategic integration, and we look forward to sharing further progress in the years to come.

KEN JONES
DIRECTOR, SUSTAINABILITY

Our third Climate Strategy Report showcases how B2Gold is increasingly embedding climate risk management in our business planning and investment decisions.

01

CLIMATE STRATEGY INTRODUCTION

INTRODUCTION

B2Gold Corp. (B2Gold or the Company) acknowledges that climate change is one of the most significant global challenges of our time, with far-reaching consequences for our planet, society, and business. As such, the Company recognizes the need to take substantial steps to address climate change risks across its operations, maintain business resilience, and meet the global goal of limiting warming to well below 2°C.

This Climate Strategy Report (Report) is our third annual report in line with the Task Force on Climate-related Financial Disclosures (TCFD) recommendations. It presents stakeholders with an understanding of how we take action to manage our climate impacts and climate-related risks to the Company. In this Report, we outline the Company's focus on setting science-informed emissions reduction targets, mitigating physical and transitional climate-related risks, reducing our carbon footprint, and providing regular disclosure to stakeholders on our climate performance.

This Report follows the reporting scope of our annual Responsible Mining Report, focusing on our three operating mines (Fekola Complex¹ in Mali, Masbate Gold Project in the Philippines, and Otjikoto Mine in Namibia). Data presented in this Report covers 1 January to 31 December 2023, unless otherwise stated. This Report has not been externally assured.

As a responsible mining company, B2Gold is committed to developing resources in a way that is protective of people, respectful of human rights and cultural heritage, creates socio-economic development, and mitigates environmental and biodiversity impacts.

ABOUT B2GOLD

B2Gold is a low-cost international senior gold producer committed to responsible mining practices, headquartered in Vancouver, Canada. Founded in 2007, B2Gold has operating gold mines in Mali, the Philippines and Namibia, and a portfolio of exploration and development projects in several countries, including Mali, Finland, and Cote d'Ivoire.

In April 2023, B2Gold completed the acquisition of Sabina Gold & Silver Corp. (Sabina) and its 100% owned Back River Gold District located in Nunavut, Canada. The Back River Gold District consists of five mineral claims blocks along an 80-kilometre belt. Construction is underway at the most advanced project in the district, the Goose Project, which is scheduled for its first gold pour in the second quarter of 2025.

As of October 2023, B2Gold owns 100% of the Gramalote Project, following the acquisition of AngloGold Ashanti's 50% interest. B2Gold's in-house project team has commenced work on various smaller-scale project development plans, with the goal of identifying a higher-return project than the previously contemplated joint venture development plan. B2Gold completed a detailed review of the Gramalote

Project; the results of which were used by B2Gold to determine the optimal parameters and assumptions for a preliminary economic assessment, which is expected to be completed by the end of the second quarter of 2024.

As a responsible mining company, B2Gold is committed to developing resources in a way that is protective of people and respectful of human rights and cultural heritage, creates socio-economic development, and mitigates environmental and biodiversity impacts. Our management approach is to work within social, economic, and environmental contexts in a way that delivers positive and sustainable outcomes for our business and for all our stakeholders.

Our approach and commitment are reflected across the Company, starting with our Board of Directors (Board) and its Sustainability Committee and its governing charter, alongside our policies on Social Responsibility and Human Rights, Occupational Health and Safety, and Environment and Biodiversity.

¹The Fekola Complex is comprised of the Fekola Mine (the Medinandi permit hosts the Fekola and Cardinal zones) and Fekola Regional (which includes the Anaconda Area [Bantako, Menankoto and Bakolobi permits] and the Dandoko permits).

02

CLIMATE STRATEGY GOVERNANCE

TCFD DISCLOSURES in this section

- A. DESCRIBE THE BOARD'S OVERSIGHT OF CLIMATE-RELATED RISKS
- B. DESCRIBE MANAGEMENT'S ROLE IN ASSESSING AND MANAGING CLIMATE-RELATED RISKS AND OPPORTUNITIES

GOVERNANCE

Climate risk management is embedded at all levels of B2Gold, from the Board to our site general managers.

As a responsible mining company, B2Gold is committed to developing resources in a way that is protective of people, respectful of human rights and cultural heritage, creates socio-economic development, and mitigates environmental and biodiversity impacts.

BOARD

The Board maintains oversight of climate-related and other sustainability issues in B2Gold through its Sustainability Committee. Responsibility for climate-related issues is explicitly acknowledged within the Sustainability Committee Charter, including oversight of the climate strategy. The Sustainability Committee meets quarterly with B2Gold’s Chief Operating Officer (COO) and representatives of the Sustainability department to review current and emerging sustainability issues, to evaluate performance and risk management, and to evaluate and update policies and procedures.

CORPORATE MANAGEMENT

At a corporate management level, climate issues and the associated climate strategy are overseen by our Senior Management team. B2Gold’s Director of Sustainability leads the Sustainability department and is responsible for the day-to-day implementation of the Company’s climate strategy and action plan, and provides regular updates to the Senior Management team.

B2Gold has a corporate Climate Risk Management Committee (Climate Committee), comprised of representatives from the Operations and Sustainability departments, with review and support from Finance and Risk Management senior staff as required. The purpose of the Climate Committee is to identify climate-related risks, opportunities and priorities across B2Gold, and to ensure that opportunities to reduce GHG emissions are identified and achieved. The Climate Committee meets on an as-needed basis, but no less than quarterly. The Sustainability department is responsible for communicating climate risks to the Senior Management team and Sustainability Committee, and for working with the site operational teams to implement climate risk management actions as identified by the Climate Committee.

Relevant climate risks are publicly disclosed in our annual Responsible Mining Report, available on B2Gold’s website (www.b2gold.com), and climate-specific disclosures such as this Report.

CORPORATE MANAGEMENT REMUNERATION

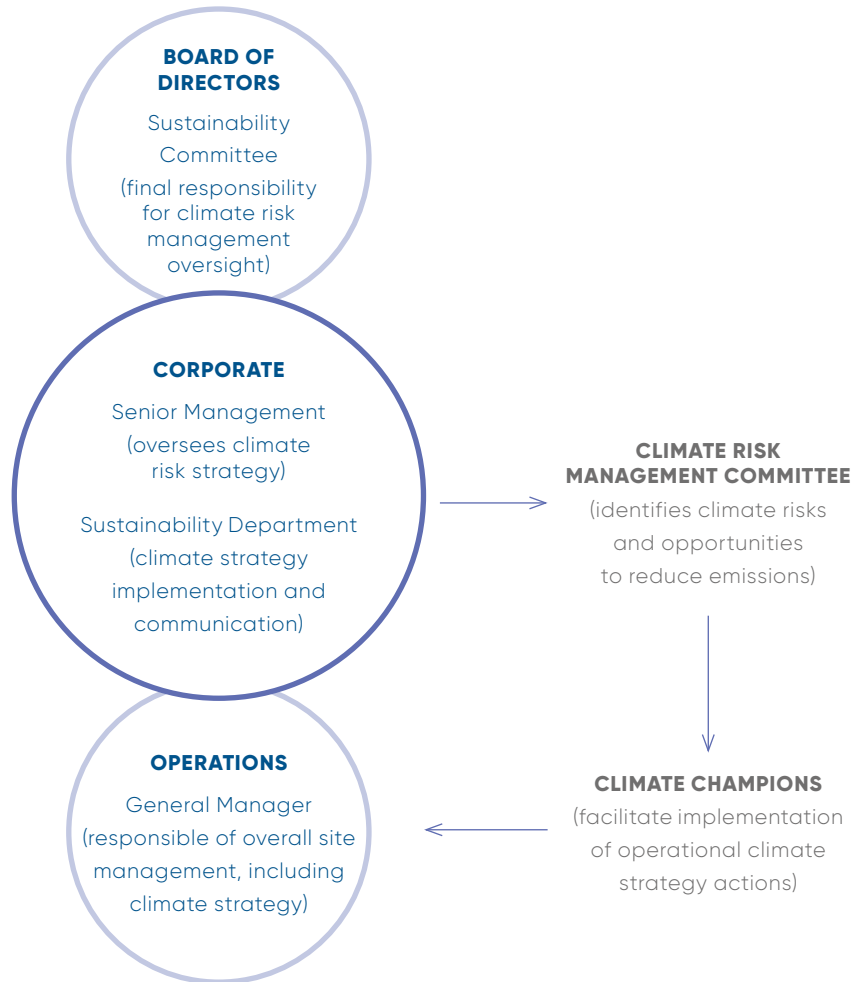

Our short-term incentive scorecard (which applies to all named executive officers including the Chief Executive Officer [CEO]) includes a standalone environmental, social and governance (ESG) category whose weighting is 20% of the overall scorecard, which includes various safety, environmental, and social components.

OPERATIONS

At our operations, the General Manager has overall site accountability for ensuring that actions identified by the corporate Climate Committee are implemented. Each of our operations has Climate Champions, who advocate for B2Gold’s climate strategy and ensure that actions are tracked, actioned, and closed out. In 2023, our Climate Champions led the development of site-specific Climate Action Plans to guide climate risk management activities.

Our climate risk management governance structure is presented in Figure 1.

Figure 1 | Climate Risk Management Governance Structure

POLICIES, STANDARDS AND COMMITMENTS

B2Gold maintains a set of sustainability policies and standards that establish our health, safety, environmental and social commitments, and define the performance requirements to manage risk and help the Company meet its sustainability obligations. These policies and standards contain specific requirements for energy and GHG emissions management:

- B2Gold’s **Environmental and Biodiversity Policy** (available at www.b2gold.com) acknowledges that human activities contribute to climate change and that B2Gold has a responsibility to address its climate impacts.
- B2Gold’s **Environmental and Biodiversity Performance Standards** (available at www.b2gold.com) provide operations with the Company’s expectations of the minimum standards to be met to consistently and effectively manage the key risks associated with the environment and effects on biodiversity. In early 2024, we updated our suite of Environmental and Biodiversity Performance Standards, which included the addition of a stand-alone **Climate Change and Energy Management Standard**. The purpose of the Climate Change and Energy Management Standard is to define the requirements for managing climate risk and reducing GHG emissions at our operations.
- The **Sustainability Strategic Plan** (Strategic Plan) identifies key environmental and social aspects for improvement and defines specific objectives for our operations. The Strategic Plan provides a road map for improved environmental and social risk management and performance in line with the Company’s ESG priorities. The Strategic Plan includes “climate risk” as one of our key aspects.

As a member of the World Gold Council (WGC), we are required to conform to their **Responsible Gold Mining Principles** (RGMPs). RGMP Principle 10: *Water, energy and climate change* requires that member companies support the objectives of global climate accords through the avoidance, reduction or mitigation of carbon emissions. As at the end of 2023, B2Gold was in conformance with Principle 10 of the RGMPs.

Our RGMP reports are available at www.b2gold.com.

03

CLIMATE RISK MANAGEMENT STRATEGY

TCFD DISCLOSURES in this section

- A. DESCRIBE THE CLIMATE-RELATED RISKS AND OPPORTUNITIES THE ORGANIZATION HAS IDENTIFIED OVER THE SHORT, MEDIUM AND LONG TERM
- B. DESCRIBE THE IMPACT OF CLIMATE-RELATED RISKS AND OPPORTUNITIES ON THE ORGANIZATION'S BUSINESSES, STRATEGY, AND FINANCIAL PLANNING
- C. DESCRIBE THE RESILIENCE OF THE ORGANIZATION'S STRATEGY, TAKING INTO CONSIDERATION DIFFERENT CLIMATE-RELATED SCENARIOS, INCLUDING A 2°C OR LOWER SCENARIO

CLIMATE RISK MANAGEMENT STRATEGY

B2Gold recognizes that environmental and social responsibility are critical aspects of effectively operating our business. We support the objectives set by the Paris Agreement to limit the rise in global temperature to well below 2°C, and we will continue to evaluate our climate risk management initiatives to align with these objectives.

Our strategy for contributing to the global climate change action contains the following objectives:

Identify and understand our climate risks (physical and transitional) and incorporate mitigation measures to make the Company more resilient as society transitions to a low-carbon society.

Establish and report progress against science-informed emissions reductions targets, including maintaining **an updated GHG emissions inventory** (Scope 1, 2 and 3 emissions). B2Gold is committed to **reducing its Scope 1 and 2 GHG emissions by 30%** by 2030 (from a 2021 base year).

Evaluate and implement changes to our energy and fuel sources to **increase the proportion of renewable energy** used in our operations. We are pursuing various initiatives to increase energy efficiency at our operations and to increase the proportion of our renewable energy sources of our total energy consumption in order to meet this commitment.

Continuously **improve our disclosure** on our climate risk management performance to align with the TCFD recommendations. Since 2016, B2Gold has reported annually on climate risk management in our Responsible Mining Report and in 2021 we released our inaugural Climate Strategy Report.

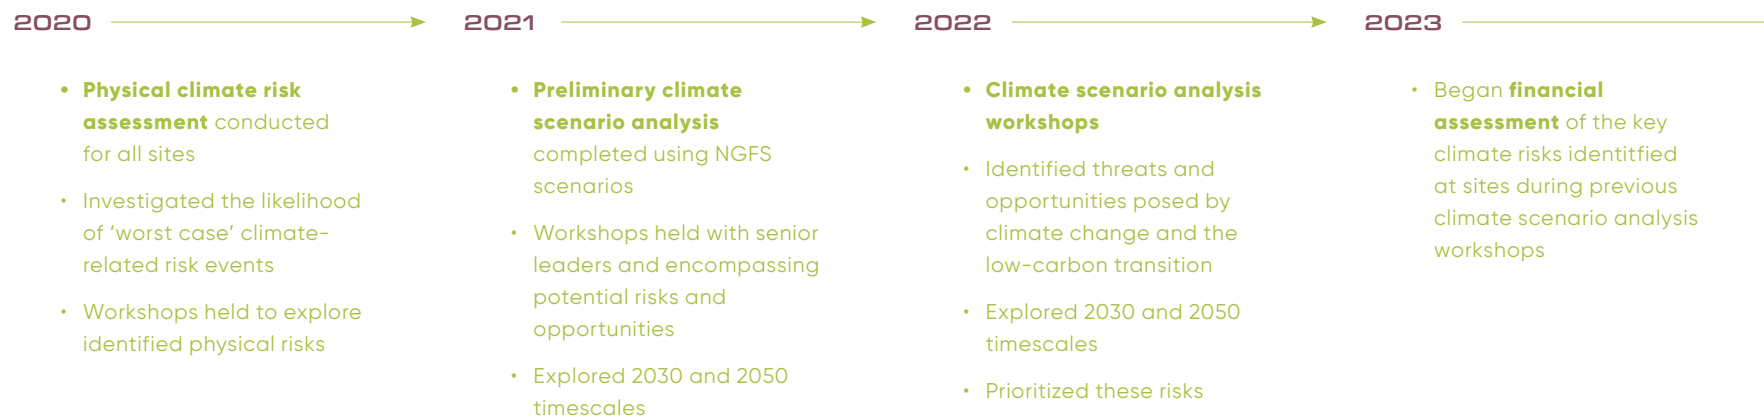

B2Gold’s climate strategy allows it to effectively manage the risks and opportunities associated with climate change. The Company aims to reduce its carbon footprint while simultaneously bolstering the resilience of its business and the communities it serves. The governance processes of B2Gold are designed to support and integrate the climate strategy into the Company’s decision-making at both strategic and operational levels. This holistic approach demonstrates B2Gold’s commitment to sustainability and recognizes the importance of climate change as a significant risk and opportunity for businesses. By implementing measures to mitigate the impacts of climate change and adapt to its long-term effects, B2Gold is positioning itself for success in an ever-evolving business landscape.

CLIMATE-RELATED RISKS AND OPPORTUNITIES

Organizations can undertake a scenario analysis to identify and assess the potential business implications of climate-related risks and opportunities under different future states. B2Gold has taken an iterative approach to identifying and assessing climate-related risks, including conducting a Climate Risk Assessment, scenario risk workshops with senior leaders, and scenario risk workshops with our operations. Figure 2 presents B2Gold’s timeline of climate scenario analysis activities.

“Our approach to financial modelling utilizes the Network for Greening the Financial System (NGFS) scenarios and is in line with internal processes, targets, and requirements.

Figure 2 | Timeline of Climate Scenario Analysis Activities

In 2023, we began to financially assess the key climate risks that were identified at sites during the previous climate scenario analysis workshops held in 2022. Our approach to financial modelling utilizes the Network for Greening the Financial System (NGFS) scenarios and is in line with internal processes, targets, and requirements. To assess the financial implications of specific climate risks, we reference life of mine plans for quantitative information relevant to the risk. This type of assessment enables a full picture of the specific risk,

including a better understanding of the financial materiality and potential implications of the risk, and it provides a business case for climate risk control strategies and mitigation efforts.

Potential material future financial impacts can be summarized into transition risks (those risks associated with transitioning to a low-carbon world, categorized as Market, Technology, Reputation, and Policy and Legal risks) and physical risks (those risks associated with the physical impacts of climate

change). Transition risks tend to materialize earlier than physical risks, including the timing of policy actions that underpin them. Physical risks can be either acute or chronic. Extreme weather events such as storms would be typical acute risks, and gradually increasing water stress would be an example of a chronic risk. Physical risks can vary significantly from one site or region to another. Climate-related risks present opportunities for organizations that are better able to respond strategically to the challenges they face.

An overview of B2Gold’s climate-related risks and opportunities, including a discussion of our key risks, is presented below.

Table 1. Overview of Climate-related Transition Risks and Opportunities

MARKET	TECHNOLOGY	REPUTATION	POLICY AND LEGAL
<p>Risks</p> <ul style="list-style-type: none"> • Shifting investor and wider stakeholder expectations and perceptions of the mining industry • Supply chain instability and increase in costs (particularly for fuel and electricity) • Fluctuations in gold demand/price <p>Opportunities</p> <ul style="list-style-type: none"> • Fluctuations in gold demand/price 	<p>Risks</p> <ul style="list-style-type: none"> • Cost of decarbonization <p>Opportunities</p> <ul style="list-style-type: none"> • Advancement of technological improvements to support the transition to a low-carbon economy 	<p>Risks</p> <ul style="list-style-type: none"> • Adverse social attitudes towards mining and/or B2Gold’s contribution to climate change 	<p>Risks</p> <ul style="list-style-type: none"> • Increasing carbon taxation • Changes to public policy and regulations in the jurisdictions in which we operate

Table 2. Overview of Climate-related Physical Risks

RISK TYPE	RISK	REGION		
		FEKOLA, MALI	MASBATE, PHILIPPINES	OTJIKOTO, NAMIBIA

	Wildfires	✓	✓	✓
	Flash floods		✓	✓
Chronic	Prolonged drought and decreased water availability	✓	✓	✓
	High temperatures	✓		✓

MARKET RISKS AND OPPORTUNITIES

Shifting Market Perceptions of the Mining Industry and the Gold Sector

Building on trends already being observed, it is likely that there will be stronger market expectations of mining companies regarding climate change and broader sustainability and social responsibility in the coming years. Investors may favour low-carbon producers; have greater expectations around sustainability disclosure, sector benchmarking, and alignment with the Paris Agreement; and may change their sentiment regarding mining and certain commodities. This would increase pressure to progress current efforts around operational energy efficiency and the introduction of low-carbon technology.

Mitigation measures for shifting market perceptions risks include:

- maintain regular engagement with investors;
- maintain and improve disclosure to recognized reporting standards, such as the TCFD recommendations, the Global Reporting Initiative (GRI) Standards, and the Sustainability Accounting Standards Board (SASB) Standard; and
- continue efforts to decarbonize our electricity supply and operations through the expansion of renewable energy projects, electrification of operations, and the reduction of energy usage.

Supply Chain Instability and Increases in Supply Costs

Climate change will most likely create new challenges with regard to obtaining supplies, due to higher prices, global logistical challenges, increasing geopolitical tensions, and supply shortages. Recent events such as the COVID-19 pandemic and the war in Ukraine have highlighted the vulnerability of global supply chains. Pandemics and conflict may increase in frequency as a result of climate change, creating additional supply challenges. Provision of energy is likely to prove more expensive or difficult as fossil fuels become more expensive, which may impact the price and availability of supplies, in addition to knock-on cost increases as a result of carbon pricing.

Mitigation measures for supply chain instability and increases in supply costs risks include:

- increase local procurement of supplies through the identification of local suppliers and the implementation of community investment projects that strengthen local supply chains;
- manage and/or increase the inventory and storage of consumables on and/or off site; and
- continue efforts to decarbonize our electricity supply and operations through the expansion of renewable energy projects, electrification of operations, and the reduction of energy usage.

Fluctuations in Gold Demand/Price

B2Gold's financial performance can be influenced by changes in the price of gold, which can have both positive and negative effects. On the one hand, gold is often considered a safe haven investment during times of global instability and uncertainty, potentially driving up gold prices and creating opportunities for B2Gold. However, there is also uncertainty about the role gold may play in the transition to a low-carbon economy. As such, B2Gold will need to monitor and adapt to changes in the global economy and investor sentiment in order to maintain its financial resilience and long-term success.

Mitigation measure for fluctuations in gold demand/price risk includes:

- conduct climate transition planning as a part of business and resiliency planning.

TECHNOLOGY-RELATED RISKS AND OPPORTUNITIES

Cost of Decarbonization

The requirement to decarbonize mine sites, and the associated cost of implementing low-carbon technologies, could pose a financial material risk. The same is also true for increasing research and development costs of low-carbon technologies that may be suitable for mine sites. The relatively shorter mine life of gold mining projects adds further limitations to implementing low-carbon technologies, which often require significant time and resources for research, development and implementation, in addition to their long payback periods.

Mitigation measure for technology-related risks includes:

- continue efforts to decarbonize our electricity supply and operations through the expansion of renewable energy projects and the reduction of energy usage.

Advancement of Technological Improvements to Support the Transition to a Low-carbon Economy

While there are costs associated with decarbonization, as technology improves and becomes cheaper and more efficient there will most likely be opportunities to leverage new technologies. We are increasing the proportion of renewable energy used in our operations. We are expanding our solar power plants, evaluating wind energy potential, and exploring partnerships and power purchase agreements to reduce emissions from purchased electricity. Additional improving technologies, such as the electrification of mining equipment, materials movement solutions and battery storage technologies, could further reduce GHG emissions, improve efficiencies, and enhance profits. B2Gold will continue to monitor technological developments and implement solutions where opportunities exist.

REPUTATION-RELATED RISKS

Adverse Social Attitudes Towards the Gold Mining Industry and its Role in the Green Transition

As a result of the mining industry's perceived role as a significant GHG contributor, along with existing mixed public perceptions of mining, there is the potential for stakeholder groups to increase the public's attention regarding mining and damage the reputation of the industry, resulting in the reduced viability of ongoing operations should social opposition occur or the attraction of staff become difficult.

Mitigation measures for reputation-related risks include:

- maintain and improve disclosure to recognized reporting standards, such as the TCFD, GRI and SASB;
- continue implementing and improving community investment programs in order to improve food and water security, improve education and health outcomes, and strengthen local livelihoods; and
- design and implement signature environmental and social projects through partnerships with local stakeholders and expert groups.

POLICY- AND LEGAL-RELATED RISKS

Changes to National and International Policies

It is possible that negative perceptions of the mining industry and its perceived role as a significant GHG contributor, in conjunction with increasing expectations around legally mandated climate-related disclosure, may lead governments to implement regulatory changes. As a result of international treaties and pressures to meet Paris-aligned targets with regard to climate change, there may be changes in government policies that result in more difficult operating environments, higher regulatory hurdles, and/or less profits.

Increasing Carbon Pricing

Future carbon prices are a key variable that could have direct financial impacts on many organizations globally. Mining is a particularly carbon-intensive industry; hence, carbon pricing has the potential to cause substantive impacts on the business in terms of capital and operational expenditure. In addition to direct carbon pricing costs, the knock-on effects of carbon pricing could extend along the supply chain, affecting costs of fuel and other production consumables, spares, and raw materials. There is also the potential for border adjustment mechanisms to have a direct financial impact where we operate in countries that do not have a carbon price.

Mitigation measures for policy- and legal-related risks include:

- maintain regular monitoring of legal developments in our operating jurisdictions as well as regular engagement with government representatives; and
- continue efforts to decarbonize our electricity supply and operations through the expansion of renewable energy projects, electrification of operations, and the reduction of energy usage.

ACUTE PHYSICAL RISKS

Wildfires

With the changing climates there is an increased likelihood of drier seasons, drought, and high temperatures. These, in conjunction with more frequent lightning storms, may result in more wildfires. This is of particular concern where we operate in arid and semi-arid regions. Wildfires may result in potential employee and local community injuries, damage to assets and the natural environment, difficulties in getting supplies and employees to and from sites, and limits to the amount of water available for operations.

Increased Frequency and Severity of Storms

A key physical risk is the projected increasing frequency and severity of storms or typhoons. As a result of these events, there is the potential for serious incidents such as tailings overtopping and slope failures. Other risks include reagent spills, building damage, shipment delays, flooding of mines, and vegetation loss on dumps and rehabilitation sites. Broader impacts include destruction of local infrastructure, changes to hydrology, and potential changes in people’s ability or tolerance to live in the area. This is of particular concern where we operate in storm or typhoon risk areas.

Floods

Extreme weather events such as storms are likely to produce higher flood risks, which could result in site, community, and supply chain damage and disruption. The risk of flooding further increases following drought events, which are also predicted to increase with climate change. Floods could cause loss of livelihoods to local communities, resulting in fewer people living in the area or poorer living conditions.

Mitigation measures for acute physical risks include:

- conduct vulnerability assessments for physical climate change risks;
- conduct physical audits of infrastructure and controls in place for climate risks, ensuring that they are stress-tested against future scenarios;
- update drainage management plans with more adapted engineering controls, dams, zoning, etc.; and
- regularly review and update emergency preparedness plans and provide appropriate training to relevant personnel.

CHRONIC PHYSICAL RISKS

Prolonged Drought and Decreased Water Availability

Water availability is identified as a key material risk across the mining industry. High demands for water resources may cause impacts to water availability, for both the maintenance of mining operations and use by nearby communities. Water scarcity can also impact the surrounding communities that rely on the same water sources as the mine. This can lead to reduced access to clean water for drinking, cooking and hygiene, and may also impact food security. Prolonged drought can also have significant impacts on local ecosystems and biodiversity, including the potential to adversely affect remediation efforts and long-term rehabilitation success. As water becomes scarcer, competition for limited resources can lead to conflict and social unrest between large mine operations and local communities. Water use restrictions or increased costs may be implemented to ensure that water is shared in a fair manner, which may limit the ability to operate in an economic or desirable manner.

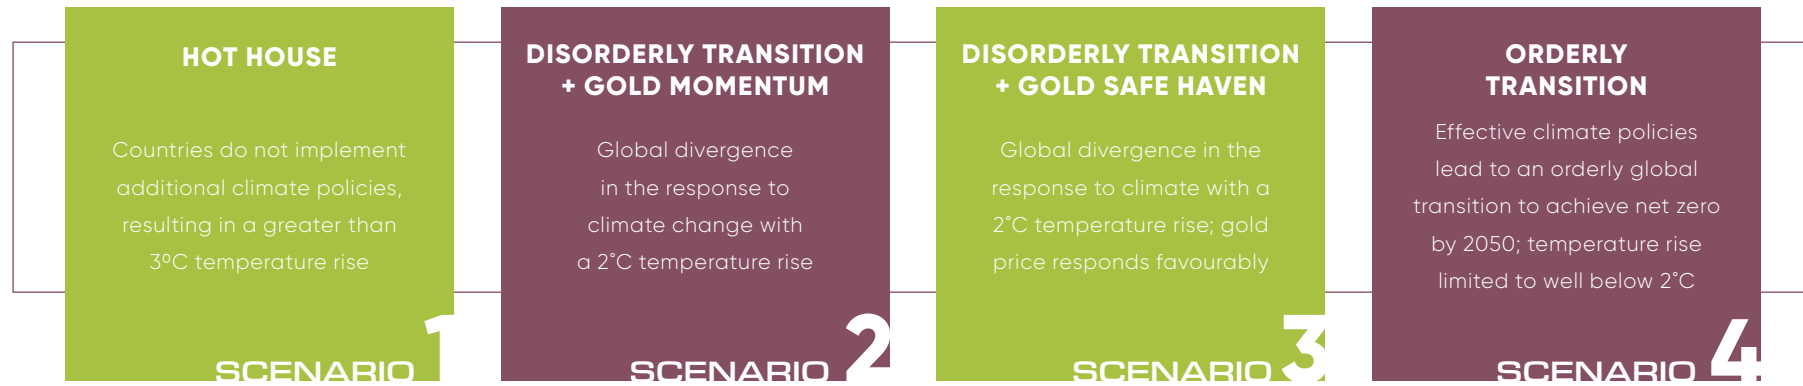

Mitigation measures for chronic physical risks include:

- decrease water consumption and increase water recycling rates, and collaborate with other water users on a watershed basis through the implementation of our Global Water Strategy; and
- incorporate future climate scenarios within mine rehabilitation and closure planning.

Assessing Resilience Through Scenario Analysis

A forward-looking assessment of climate-related risk and opportunity is a fundamental element of our climate strategy and the TCFD process. This embeds climate-related issues into our business; however, it also presents well-recognized challenges, such as dealing with timescales that are longer than usual business planning cycles and uncertainties in many areas, including emissions pathways and policy responses. Accordingly, a scenario analysis is an important tool for assessing the potential business implications of climate-related risk and opportunities and for communicating to our stakeholders how we are managing and responding to these risks and opportunities.

In 2022, we updated four climate-related scenarios, considering both transition and physical risks. Our scenario analysis was conducted with internal and external experts across multiple disciplines and with our corporate and site management teams, and it explores 2030 and 2050 timescales. We leveraged scenarios from the NGFS to frame our climate scenarios.² The NGFS scenarios provide a common reference point for understanding how climate change and policy and technology trends could evolve in different futures. Each climate scenario allows us to develop an understanding of how the different climate risk profiles for our sites might change in response to policy responses, carbon price schemes, and social and climate impacts. Details on our climate scenario analysis are presented in Table 3.

In 2023, we continued to review transition and physical risks, and began the process of assessing the potential financial impacts of key risks within the context of the four scenarios presented above. Financial modelling allows for a better understanding of the implications of short-, medium- and long-term impacts. The financial quantification methodology taken engaged sites and key personnel to assess the selected risks in more detail

and with a financial lens. Quantification leveraged relevant life of mine plans and financial models/data from within the Company to calculate potential impacts of the risk at different time horizons in the different climate scenarios.

This methodology enables a full picture of the specific risk. Focusing on fewer risks, but more material risks, has allowed detailed data to be used to enable outcomes that are more accurate and valuable for planning and decision making.

² The NGFS scenarios are utilised as they are informed by expert groups of climate scientists and economists, and data relating to scenarios is regularly updated. When updating any internal work, we always use the most up-to-date data. In November 2023, Phase 4 was released, which included updated scenarios and the retirement of the Divergent scenario. All work completed thus far since November (including risk quantification) has continued to use Divergent data from Phase 3 to ensure that work is internally consistent. In 2024, scenarios used internally will be updated to reflect the NGFS updates.

Table 3. Climate Scenario Analysis

SCENARIO	ASSUMPTIONS	OUTCOMES
SCENARIO ONE: Hot House	<p>Scenario One assumes that countries only implement climate change policies that are currently signed into law. This will result in a severe average global temperature rise of between 4°C and 6°C by 2050.</p>	<ul style="list-style-type: none"> Physical risks identified were more extreme – droughts, floods and storms have high impacts and require high action Supply chain disruption is a high priority due to physical climate disruptions Food and water insecurity are high as a result of physical impacts and supply chain disruption Increasing corruption in regions prone to corruption due to strained geopolitics Carbon prices remain low and divergent or changing regulations are no longer considered relevant Low litigation risk
SCENARIO TWO: Disorderly Transition + Gold Momentum	<p>Scenario Two sees a global divergence in the response to climate change, with certain countries pursuing aggressive net zero actions and others failing to act. Associated global risks include:</p> <ul style="list-style-type: none"> moderate to high physical and transition risks; supply chain impacts and fuel cost spikes due to uncertainty; potential for differentiated markets to emerge (e.g., voluntary carbon market); and potential extreme requirements for Canada/investors. <p>In Scenario Two, the gold price remains relatively steady, increasing with inflation, but not enough to cover the costs of carbon taxes.</p>	<ul style="list-style-type: none"> Supply chain instability is a high priority due to global demand for fuel and other alternative sources Some extreme weather events Divergent regulation requires some action, depending on the jurisdiction Carbon pricing increases in some jurisdictions, with financial impacts for the Company
SCENARIO THREE: Disorderly Transition + Gold Safe Haven	<p>As with Scenario Two; however, in Scenario Three the gold price responds favourably and vigorously in a “transition crisis”.</p>	<ul style="list-style-type: none"> Supply chain instability is a high priority and the Company experiences pressure to produce more gold Some extreme weather events, however, these require less action due to more capital availability High investor expectations related to production Regulations requiring action have minimal impact due to the high metal price
SCENARIO FOUR: Orderly Transition	<p>Scenario Four assumes an orderly global transition to achieve net zero by 2050:</p> <ul style="list-style-type: none"> Climate change is constrained to a 2°C scenario Expert climate policies emerge, and carbon prices increase steadily along with the energy price Litigation culture increases, including laws regarding the perpetuity of responsibility Stakeholders are climate-aware with an increased scrutiny of mining Investors have higher ESG expectations Limited contractor availability as transition drives the green revolution Significant innovation 	<ul style="list-style-type: none"> Physical risks identified decrease in potential impact Limited water and food shortages Carbon price increases have a significant impact on capital availability Some supply chain instability (fuel shortages due to phasing out of fossil fuels and demand for green technologies)

04 RISK MANAGEMENT

TCFD DISCLOSURES in this section

- A. DESCRIBE THE ORGANIZATION'S PROCESSES FOR IDENTIFYING AND ASSESSING CLIMATE-RELATED RISKS
- B. DESCRIBE THE ORGANIZATION'S PROCESSES FOR MANAGING CLIMATE-RELATED RISKS
- C. DESCRIBE HOW PROCESSES FOR IDENTIFYING, ASSESSING, AND MANAGING CLIMATE-RELATED RISKS ARE INTEGRATED INTO THE ORGANIZATION'S OVERALL RISK MANAGEMENT

RISK MANAGEMENT

Identifying, managing, and effectively dealing with risk is an integral part of how we protect and create sustainable value throughout our business. Aligned with our climate strategy approach to managing climate risks, we regularly assess climate-related risks to inform business planning and decision making.

B2Gold's risk identification and management process assesses the likelihood and consequences of risk events that we may face, including those related to climate change. B2Gold implements a hierarchy of three inter-related risk management processes:

1. Enterprise Risk Management (ERM)
2. Operational and Project Risk Management
3. Personal Risk Management

Enterprise risks are tracked and reported in a Company-wide Enterprise Risk Register. Risks are identified through in-depth "risk review events" with Senior Management³ of each reporting unit (Fekola, Masbate, Otjikoto, Exploration, and Corporate). Risks are identified under broad categories⁴ and a detailed review of these risk factors is presented in the Company's Annual Information Form. A consolidated summary of top risks is presented annually to the Board, along with a quarterly update based on a high-level review. The annual presentation includes an analysis of how top risks have changed from year to year, detailed controls and monitoring activities to mitigate the risk, the adequacy of mitigation measures, actions to be

taken, and the key early warning indicators used to monitor the risk. The quarterly update focuses on major risk movements over the previous three months.

Operational risks are those that have the potential to materially impact individual sites or projects. Personal risk management is focused on the safety of individuals in the workplace. Each site maintains a site-level risk register, which they manage and update, and implements relevant management plans and safe operating or work procedures to ensure that site activities are carried out in a manner protective of human health and safety and the environment. Site-level risks, procedures, and practices are reviewed regularly at both site and corporate levels.

B2GOLD'S USE OF INTERNAL CARBON PRICES

B2Gold conducts cost-of-carbon financial analyses for life of mine business planning and significant capital investment and mergers and acquisitions. This analysis involves using a shadow price of carbon that is based on the projected costs of future carbon pricing schemes. The aim is to assess an investment's embedded carbon risk and compare different options based on their exposure to future carbon pricing mechanisms.

B2Gold uses a shadow price of USD40 and USD80 per tonne of CO₂e to evaluate the impact of the cost of carbon. This price

The Board has overall responsibility for identifying and understanding the principal risks of the Company's business. The Board fulfills its mandate directly and through its four standing committees: the Audit Committee, the Corporate Governance and Nominating Committee, the Compensation Committee, and the Sustainability Committee. The Sustainability Committee maintains oversight of sustainability matters, including climate-related risks. In 2023, the Sustainability Committee met with management four times to review current and emerging issues, to evaluate performance and risk management, and to evaluate and update sustainability policies and procedures.

is aligned with the recommendations from the Report of the High-Level Commission on Carbon Prices (2017).

As carbon pricing mechanisms are expected to be implemented globally on an ad hoc basis in the next decade, and this represents a financial risk to businesses. To address this, B2Gold is focused on investing in renewable energy and implementing strategies to achieve its 2030 targets, thereby incentivizing a planned transition to a low-carbon economy.

³ Including representatives from Community Relations, Corporate/Government Affairs, Environment, Exploration, Finance, Health and Safety, Human Resources, Insurance, Legal/Compliance, Operations, and Systems and IT.

⁴ Includes Political, Reputational, Operational, Human Capital, Market, Tax, Technology, Geological, Ethical Conduct, Continuity/Opportunity, and Health, Safety and Environment.

05

PERFORMANCE METRICS AND TARGETS

TCFD DISCLOSURES in this section

- A. DISCLOSE THE METRICS USED TO ASSESS CLIMATE-RELATED RISKS AND OPPORTUNITIES IN LINE WITH ITS STRATEGY AND RISK MANAGEMENT PROCESS
- B. DISCLOSE SCOPE 1, SCOPE 2 AND, IF APPROPRIATE, SCOPE 3 GHG EMISSIONS AND THE RELATED RISKS
- C. DESCRIBE THE TARGETS USED BY THE ORGANIZATION TO MANAGE CLIMATE-RELATED RISKS AND OPPORTUNITIES AND PERFORMANCE AGAINST THE TARGETS

PERFORMANCE METRICS AND TARGETS

CLIMATE TARGETS

B2Gold uses several metrics and targets to allow us to measure and disclose our performance in managing climate-related risks and opportunities. Most notably, in early 2023 B2Gold announced our commitment to reducing Scope 1 and 2 GHG emissions by 30% by 2030 against a 2021 baseline. Operations included within this target include our Fekola, Masbate and Otjikoto mines. Our target is an aggregate reduction of our consolidated baseline; we do not expect uniform GHG emissions reductions from each operating mine.

This target represents an absolute reduction of approximately 217,000 tonnes of CO₂e from our 2021 baseline, and it was built on extensive foundational work from 2021 to 2022 to evaluate

baseline data and energy consumption trends and to identify GHG emission reduction opportunities at our sites. Key to advancing emissions reductions and achieving our climate target is the involvement of our operations, including their ownership and implementation of climate actions.

In 2022, we established a target for each operation to formalize site-specific Climate Action Plans in 2023. These plans were developed in 2023 and identify local climate risks, energy efficiency and reduction measures, emissions management and reduction measures, climate adaptation actions, and climate awareness and sensitization actions.

CRITERIA FOR UPDATING OUR EMISSIONS BASELINE

B2Gold will update our emissions baseline if there is a material change to our Scope 1 and 2 baseline year GHG emissions as a result of a major change in the calculation methodology or a major change in the Company's profile (i.e., divestment/acquisition/construction of a new operation).

DECARBONIZATION PATHWAY

In order to achieve our GHG emissions reduction target, B2Gold is pursuing various initiatives to increase the proportion of renewable energy sources in our electricity supply, to electrify operations, and to improve energy efficiency. The majority of our Scope 1 and 2 GHG emissions are a result of electrical power generation and mine fleet activity. Therefore, increasing the proportion of renewable energy sources in our electricity supply and heavy fuel oil (HFO)/diesel alternatives is critical to our decarbonization approach.

Our initial focus is to decarbonize our electricity supply, which will then facilitate electrification and diesel displacement in our mining operations. B2Gold is proud to be an industry leader in the implementation of renewable energy solutions to actively manage our emissions. Our Otjikoto and Fekola operations maintain fully autonomous hybrid solar power plants (consisting of 6-megawatt [MW] and 30-MW solar components, respectively). We are also expanding our Fekola solar plant, which will increase our solar power capacity by 22 MW. Construction is currently underway and is estimated to be complete in the fourth quarter of 2024. The solar plant expansion is expected to reduce GHG emissions by an additional 24,000 tonnes per year.

At our Otjikoto Mine, we commissioned the connection of the mine to the Namibian electrical grid in September 2022. This connection lowers our power generation emissions by more than 30% per year due to renewable energy sources within the Namibian grid. In addition, under the recently introduced “modified single buyer” energy market in Namibia, allowing for the purchase of electricity from local independent power producers (IPP), we have entered into a power purchase agreement with an IPP for the construction of a 10-MW solar plant at the Eldorado power sub-station near the Otjikoto Mine. This solar plant, once commissioned towards the end of 2024, will provide approximately 25% of the mine’s electricity from renewable solar energy. The combination of the existing solar plant, the IPP-purchased solar power, and the renewable energy sources within the Namibian grid will bring the proportion of renewable energy in the mine’s power supply to greater than 40%.

While the current focus of our decarbonization strategy is increasing the proportion of renewable energy sources in our electricity supply, we are also evaluating and monitoring several additional avenues for carbon reduction. These include enhancing energy efficiency, exploring alternative fuels, optimizing fleet management through electrification, and assessing options for materials movement. Some technologies require advancement or conditions (e.g., market, security) before they become technically or economically feasible. B2Gold is proactively engaging with industry-leading suppliers to ensure that as advancements are made, we remain at the forefront of adopting innovative solutions. This commitment to collaboration and innovation is a cornerstone of our strategy to overcome technical obstacles, and it will allow us to capitalize on emerging technologies that align with our decarbonization goals.

The proposed phases of our decarbonization pathway are as follows:

2023–2027

DECARBONIZE ELECTRICITY SUPPLY

Focus on converting purchased and self-generated electricity from a fossil fuel-based supply to renewable sources, and on progressing feasibility studies for diesel displacement.

Example projects include:

- expand solar plant in Mali;
- determine the feasibility of solar power generation in the Philippines;
- identify options for improving battery storage;
- determine the feasibility of other renewables (e.g., wind); and
- partnerships and power purchase agreements to increase the renewable energy component of purchased electricity.

2028–2032

DECARBONIZE OPERATIONS

Continue to focus on a greening electricity supply, and on investing in diesel displacement with regard to materials movement, light vehicles, and stationary equipment.

Example projects include:

- electrification of mobile equipment and vehicles; and
- materials movement solutions (e.g., trolley assist, in-pit crushing and conveyance, overland conveyance).

SUPPLEMENT EMISSIONS REDUCTION ACTIVITIES WITH CARBON OFFSETTING

USE OF CARBON OFFSETS

B2Gold may use carbon offsets in a temporary or transitional capacity while emissions abatement options are being studied, and while we pursue material decarbonization opportunities with medium- to long-term implementation timeframes and for “hard to abate” emissions with limited or no current technological solutions. Our formal approach to carbon offsetting is based on the following commitments:

- B2Gold will follow the mitigation hierarchy for reducing GHG emissions and continue efforts to combat climate change.
- B2Gold will supplement emission reduction activities with the use of carbon offsets, as one component of the Company’s emissions reduction strategy.
- B2Gold will adhere to the principles of high-quality offsets and will purchase offsets through reputable organizations that can guarantee adherence to these principles.

MEASURING OUR PERFORMANCE

B2Gold uses several metrics to measure and monitor performance and progress in achieving our targets and objectives. This data also supports our climate scenario analysis and strategic and business planning processes and helps us to monitor the business environment from a strategic and risk management perspectives.

GHG Emissions

The key sources of direct GHG emissions at our operations are from the generation of electricity at operational sites to run our processing plants (crushing, grinding, leaching, electrowinning, and smelting) and the use of fuel to run mobile equipment.

We complete Scope 1, 2 and 3 GHG emissions inventories for our Fekola, Masbate and Otjikoto operations. Emissions are calculated internally, using the GHG Protocol Corporate Accounting and Reporting Standard, and the results are subject to scrutiny by a qualified external consultant.

- **Scope 1 (direct):** *Direct emissions from owned or controlled sources.* Our principal source of Scope 1 emissions is the consumption of fuel for site power generation and by equipment and vehicle fleets.
- **Scope 2 (indirect):** *Indirect emissions from the generation of purchased electricity.* Our Otjikoto operation is connected to the Namibian grid, and it is the only operation that generates Scope 2 emissions. Additional Scope 2 emissions included in our inventories are from regional offices in Bamako (Mali), Manila (Philippines) and Windhoek (Namibia).

- **Scope 3 (other indirect):** *Indirect emissions (not included in Scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions.* Sources of Scope 3 emissions included in our inventories are from the following upstream categories⁵:

- **Category 1:** Purchased goods and services
- **Category 2:** Capital goods
- **Category 3:** Fuel- and energy-related activities
- **Category 4:** Upstream transportation and distribution
- **Category 5:** Waste managed by third parties
- **Category 6:** Business travel
- **Category 7:** Employees commuting to/from sites
- **Category 8:** Upstream leased vehicles and facilities

In 2023, both our total Scope 1 and 2 GHG emissions (for the Fekola, Masbate and Otjikoto operations) and our emissions intensity decreased slightly from 2022. Our Scope 1 and 2 GHG emissions were an estimated 701 thousand tonnes CO₂e (compared with 739 thousand tonnes in 2022). Our consolidated GHG emissions intensity was 0.71 tonnes CO₂e per gold ounce produced (compared with 0.76 in 2022).

Our Fekola operation maintains a hybrid power plant (consisting of 30-MW solar and 64-MW HFO and diesel components). Total

Scope 1 and 2 GHG emissions at our Fekola operation were 350 thousand tonnes CO₂e, compared with 351 thousand tonnes CO₂e in 2022. Despite the expansion activities at the Fekola Complex, the total Scope 1 and 2 GHG emissions remained consistent with the levels recorded in 2022.

The Masbate Gold Project uses an HFO/diesel power plant to generate electricity on site. All seven production units operate on a blend of HFO and diesel. Total Scope 1 and 2 GHG emissions at Masbate were 253 thousand tonnes CO₂e (compared with 262 thousand tonnes CO₂e in 2022).

In September 2022, the Otjikoto operation connected to the national power grid, further decreasing our consumption of HFO and reducing GHG emissions. In 2023, the electricity consumed at Otjikoto came exclusively from the grid and the solar plant on site. In 2023, our total Scope 1 and 2 GHG emissions at our Otjikoto operation decreased significantly from 2022 (98 thousand tonnes CO₂e compared with 126 thousand tonnes CO₂e in 2022). This decrease is primarily due to the Otjikoto operation's connection to the national grid.

Our estimated Scope 3 GHG emissions for 2023 were 1025 thousand tonnes CO₂e (compared with 969 thousand tonnes in 2022). This increase in Scope 3 emissions is largely due to expansion activities at the Fekola Complex and the subsequent increase in spending on Purchased Goods and Services (Category 1) and Capital Goods (Category 2).

Tables 4 to 6 summarize our overall and site-specific GHG emissions and intensity.

⁵ Research conducted by the WGC indicates that Scope 3 downstream emissions associated with the end-use of gold make up less than 1% of the overall GHG emissions. Source: WGC. 2019. *Gold and Climate Change: Current and Future Impacts*.

Table 4. Consolidated Scope 1 and 2 GHG Emissions

	Units	2019	2020	2021	2022	2023
Scope 1	thousand tonnes CO ₂ e	558	637	722	729	673
Scope 2	thousand tonnes CO ₂ e	nr	0.07	0.11	10	28
Total Scope 1+2	thousand tonnes CO₂e	558	637	722	739	701
Scope 1+2 Emissions Intensity	tonnes CO₂e/gold ounce produced	0.66	0.64	0.73	0.76	0.71

NOTES

The consolidated emissions inventory and intensity includes the Fekola, Masbate and Otjikoto operations.
nr = not reported

Table 5. 2023 Scope 1 and 2 GHG Emissions by Site

	Units	Fekola	Masbate	Otjikoto	Total
Scope 1	thousand tonnes CO ₂ e	350	253	70	673
Scope 2	thousand tonnes CO ₂ e	0.03	0.02	28	28
Total Scope 1+2	thousand tonnes CO₂e	350	253	98	701
Scope 1+2 GHG Emissions Intensity	tonnes CO₂e/gold ounce produced	0.59	1.31	0.47	0.71

Table 6. 2023 Scope 3 Emissions by Category (thousand tonnes CO₂e)

	Fekola	Masbate	Otjikoto	Total
Category 1: Purchased goods and services	206	4	65	275
Category 2: Capital goods	450	48	25	524
Category 3: Fuel- and energy-related activities	88	63	23	174
Category 4: Upstream transportation and distribution	28	7	2	37
Category 5: Waste managed by third parties	0.6	0.6	0.4	2
Category 6: Business travel	5	2	0.5	7
Category 7: Employees commuting to/from sites	0.08	1	-	1
Category 8: Upstream leased vehicles and facilities	0.4	3.5	1	5
Total Scope 3	779	129	118	1,025

NOTES

Sources of Scope 3 emissions included in our inventories are from upstream categories 1-8. Research conducted by the World Gold Council indicates that Scope 3 downstream emissions associated with the end-use of gold make up less than 1% of the overall GHG emissions (WGC, 2019. *Gold and Climate Change: Current and Future Impacts*).

ENERGY AND ELECTRICITY CONSUMPTION

Our total energy consumption was 9.1 million gigajoules (GJ), the same as in 2022. Our 2023 energy intensity was 9.2 GJ per ounce of gold produced (compared with 9.4 GJ in 2022), a slight decrease due to increased gold production in 2023.

Our total electricity consumption increased to 655 gigawatt hours (GWh) of electricity (from 648 GWh in 2022). Our proportion of electricity from renewable sources increased significantly to 22.9% in 2023 from 14.3% in 2022. This increase is attributed primarily to the Otjikoto Mine’s connection to the national power grid.

The Fekola hybrid power plant generated 63 GWh of electricity from solar power, reducing HFO consumption by approximately 13.5 million litres and avoiding approximately 39,916 tonnes of CO₂e emissions in 2023.

In 2023, the Otjikoto solar plant produced 12.5 GWh of electricity, preventing the emission of 3.8 tonnes of CO₂e. Furthermore, by sourcing the remaining electricity from the national grid, an additional 67 tonnes of CO₂e emissions were avoided at our Otjikoto site.

Tables 7 to 10 summarize our energy and electricity data.

In 2024, we will increase the proportion of renewable energy used at two of our operations. The completion of the expansion of the Fekola solar plant in Mali is projected to reduce GHG emissions by approximately 23,800 tonnes per year. In Namibia, the commissioning of a third-party solar facility toward the end of the year is estimated to provide 25% of the Otjikoto Mine’s electricity. In addition to increasing the proportion of renewable energy sources in our electricity supply, we are also evaluating and monitoring several additional avenues for carbon reduction including energy efficiency and reduction, alternative fuels, optimizing fleet management and materials movement.

Table 7. Total Energy Consumption by Source (million gigajoules [GJ])

	2019	2020	2021	2022	2023
